HTRF® G9A HISTONE H3K9 MONO-METHYLATION ASSAY (me1 → me2)

TECHNICAL NOTE

ABSTRACT G9a Histone H3K9 mono-methylation assay measures the monomethylation of a biotinylated histone H3(1-21) peptide at lysine 9.

The HTRF G9a Histone H3K9 monomethylation assay uses a H3(1-21) lysine 9 mono-methylated biotinylated peptide (substrate), a Eu3+-cryptate labeled anti-H3K9 me2 detection antibody and XL665-conjugated Streptavidin (SA-XL665).

The assay is performed in a single well and run in two steps: the enzymatic step and the detection step. HTRF signal is proportional to the concentration of monomethylated H3(1-21) peptide. The assays within this technical note were performed in a 384-well plate in a 20 µL final volume.

Enzyme	G9a
Substrate	H3(1-21)K9 me1-biotin
	ARTKQTAR-K(Me1)-STGG-KAPRKQLA-GGK(Biotin)
Detection Antibody	Anti-H3K9 me2-Eu(K)

ASSAY PROTOCOL

ENZYMATIC STEP

- Prepare working solutions of enzyme, peptide substrate, cofactors and inhibitor in enzymatic buffer just prior to use.
- Add to a 384-well small volume plate in the following order:
  - 4 µL of inhibitor (2.5X) or enzymatic buffer
  - 2 µL of G9a enzyme (5X)
  - Incubate for 5 min at room temperature
  - 4 µL of H3(1-21)K9 me1-biotin peptide/ SAM pre-mixture (2.5X)
- Cover the plate with a plate sealer and incubate at room temperature.

DETECTION STEP

- Prepare detection mixture containing the anti-H3K9 me2-Eu(K) 2X according to the product datasheet recommended final concentration and SA-XL665 at 10 nM in detection buffer. Final concentration of 5 nM for SA-XL665 corresponds to 0.25X the final concentration of peptide substrate.
- Add 10 µL of detection mixture (2X) to the plate.
- Cover the plate with a plate sealer and incubate 1h at room temperature.
- Remove plate sealer and read fluorescence emission at 665nm and 620nm wavelengths on an HTRF compatible reader.

HTRF Ratio = $(665nm/620nm)X10^4$

Delta Ratio = Sample Ratio - Ratio negative

Delta F% = (Delta Ratio/Ratio Negative) X100

DISTRIBUTION: ENZYME INHIBITION STUDY

	ENZYMATIC STEP				DETECTION STEP

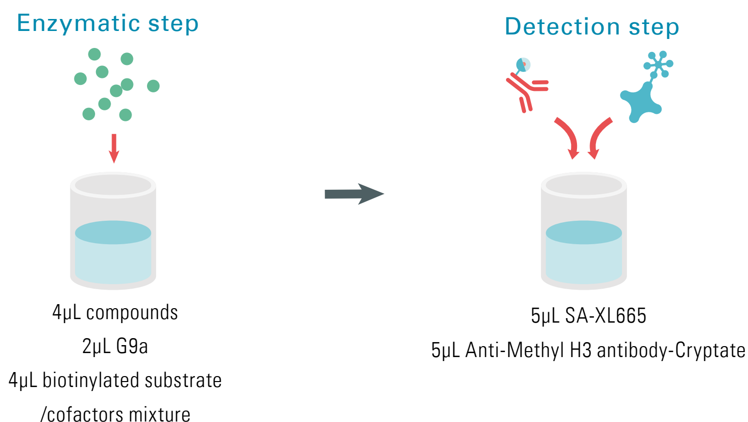
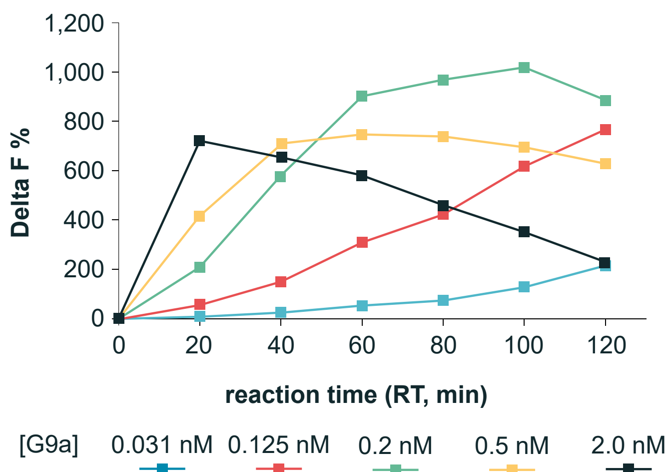
SAMPLE	-	4 µL	2 µL	4 µL	5 µL	5 µL
POSITIVE CONTROL	4 µL	-	2 µL	4 µL	5 µL	5 µL
NEGATIVE CONTROL	6 µL	-	-	4 µL	5 µL	5 µL

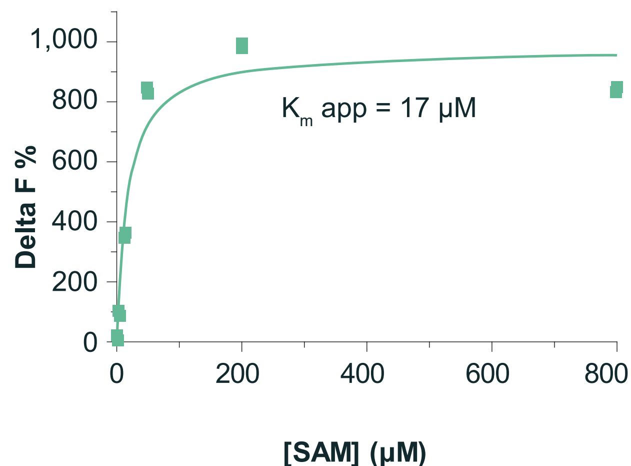


1. TIME COURSE AND ENZYME TITRATION



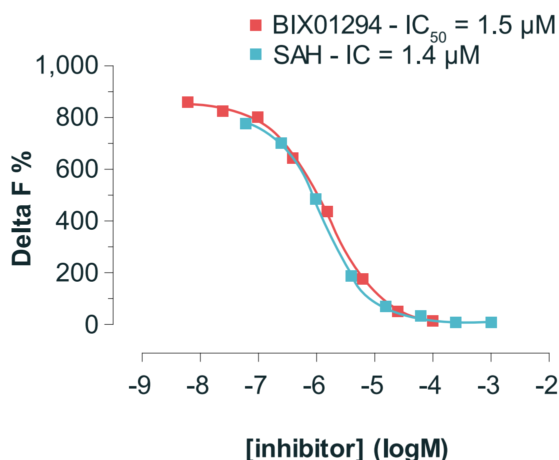
This step allows the optimal enzyme concentration and enzyme reaction time to be determined. Human recombinant G9a was serially diluted to the concentrations indicated in the figure (0.03, 0.13, 0.2, 0.5, 2 nM), and the assay was carried out with 40 nM biotinylated H3(1-21) me1 peptide substrate and 200 µM SAM. Enzyme kinetics depends on the G9a specific activity and substrate concentrations. The enzymatic reaction was carried out at RT and then stopped by adding H3K9me2-K Ab and SA-XL665 (detection reagents) after each time point (20, 40, 60, 80, 100, 120 min). For further experiments, a reaction time of 60 min at RT and 0.2 nM enzyme were selected.

2. SAM TITRATION



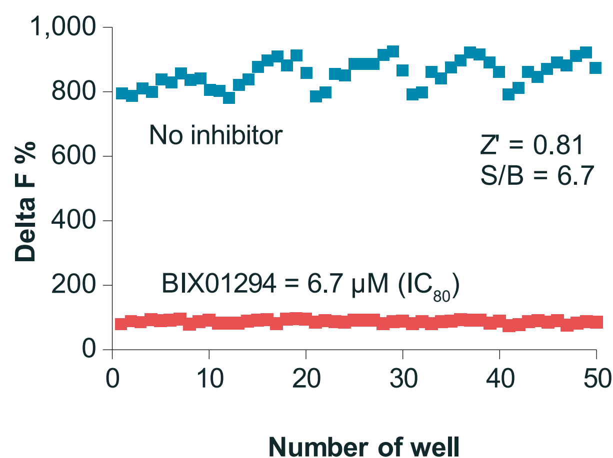
This step enables the determination of Km for SAM. The Km value was determined with 0.2 nM G9a and 40 nM biotinylated H3K9(1-21)me1 substrate in the enzymatic step. We recommend testing SAM concentrations ranging from 800 µM to 0.195 µM (serial dilutions). The enzyme reaction was stopped by adding the detection reagents at the optimal incubation period (RT, 60 min). The 17 µM Km value for SAM was determined from this experiment using a Michaelis-Menten.

3. ENZYME INHIBITION



G9a H3K9 dimethylation inhibitor assay was validated by measuring activity of BIX01294 inhibitor. This assay was performed using 20 µM SAM and 0.2 nM G9a. Serial dilutions of BIX01294 were ranged from 6.1 nM to 100 µM and pre-incubated for 5 min with G9a. Enzymatic reaction was initiated by the addition of 40 nM biotinylated H3K9 (1-21) me1 peptide substrate plus 20 µM SAM. The enzyme reaction was stopped with the detection reagents after 60 min incubation at RT. IC50 value calculated from inhibition curve was 1.5 µM .

4. Z' FACTOR DETERMINATION



The robustness of the assay was proven by performing a Z' determination with BIX01294 at IC80 (6.7 µM). The enzyme reaction was carried out with 0.2 nM G9a, 20 µM SAM and 40 nM H3K9(1-21)me1 substrate for 60 min at RT. Z' of 0.81 show the robustness of the assay.
